

ASTR 621: Planetary Science

- I. Our environment
 - 1. Molecules -3-
 - 2. Dust grains -4-
 - 3. magnetic field -5-
 - 4. Gravity, angular momentum (both important!) -6-
- II. Star formation
 - 1. Molecular clouds
 - 2. Sites of star formation
- III. Young stellar objects (YSOs) -13-
 - 1. T-Tauri stars -15-
- IV. Gravitational collapse -18-
 - 1. Comparison between observaton and theory -21-
 - 2. Note on fragmentation -22-
 - 3. Collapse \rightarrow importance of rotation -23-
 - 4. Magnetic field effects -25-
 - 5. Flux enhancement -26-
 - 6. Ambipolar diffusion -27-
 - 7. Summary of the standard model -29-
 - 8. Collapse calculations -30-
- V. The accretion disk resulting from nebular collapse -65-
 - 1. Viscosity -66-
 - 2. Vertical disk structure -69-
 - 3. Opacity of the primordial solar nebula -71-
 - 4. Radial temperature gradient -75-
- VI. Paper: *The evolution of viscous discs and the origin of the nebular variables* -77-
- VII. The minimum mass solar nebula -89-
 - 1. Disk cooling time -93-
 - 2. Gravitational instabilities within a disk -93-
 - 3. Cosmochemical constraints on the nebula -97-
- VIII. The condensation model -107-
- IX. Dust in the nebula -113-
- X. Particle motion in the nebula -124-

- XI. Processes that affect particle radial location in the nebula -129-
 - 1. Gas drag -129-
 - 2. Radiation force -129-
 - 3. Poynting-Robertson drag -130-
- XII. Yarkovski effect -132-
- XIII. Accretion
 - 1. Gas rich vs. gas free accretion -133-
 - 2. Early stages of accretion -136-
 - 3. Particles in a box -137-
 - 4. Safronov theory -138-
 - 5. Accretion rate -139-
 - 6. Accretion times for other planets -141-
 - 7. Runaway accretion -142-
